(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.

ESD SENSITIVITY CAUTION

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

NOTES:

1. Maximum output current is affected by the PCB layout, size of metal trace, the thermal conduction path between metal layers, ambient temperature and the other environment factors of system. Attention should be paid to the dropout voltage when $V_{IN} < V_{OUT} + V_{DROP}$.
2. The dropout voltage is defined as $V_{IN} - V_{OUT}$, when V_{OUT} is 100mV below the value of V_{OUT} for $V_{IN} = V_{OUT\ (NOMINAL)} + 2V$ or $6.3V$, whichever is greater.
3. Output voltage temperature coefficient is defined as the worst-case voltage change divided by the total temperature range.

TYPICAL CHARACTERISTICS

$V_{IN} = V_{OUT \text{ (NOMINAL)}} + 2V$ or $6.3V$, whichever is greater, $V_{OUT} = 3.3V$, $C_{IN} = C_{OUT} = 1\mu F$, $T_A = 25^\circ C$ unless otherwise noted.

APPLICATION NOTES

Input Capacitor and Output Capacitor

For proper operation, using a ceramic capacitor (C_{IN}) between $1\mu F$ and $10\mu F$ between the input pin and ground. The input capacitor must be located a distance of not more than 0.5 inch from the input pin of the IC and returned to a clean analog ground. The capacitor with larger value and lower ESR (equivalent series resistance) provides better PSRR and line-transient response. The output capacitor must meet both requirements for minimum amount of capacitance and ESR in all LDOs application for stable operation, use a ceramic capacitor (C_{OUT}) between $1\mu F$ and $10\mu F$. Larger values in this range will help improve load transient response and reduce noise. Output capacitors of other dielectric types may be used, but are not recommended as their capacitance can deviate greatly from their rated value over temperature.
